

# Marketing Campaign Customer Segmentation

*MIT Applied Data Science Program*

*April 2024*

# Executive Summary

OBJECTIVE	KEY INSIGHTS	NEXT STEPS
<ul style="list-style-type: none"><li>❖ Create distinct Customer Segments to help refine future marketing strategies</li><li>❖ Available customer data includes demographic info, past purchasing behavior, and past campaign responses</li></ul>	<ul style="list-style-type: none"><li>❖ K-Means clustering methods were used to identify 5 Customer Segments:<ul style="list-style-type: none"><li>➤ <b>Budget Navigators</b></li><li>➤ <b>Family Savers</b></li><li>➤ <b>Moderate Spenders</b></li><li>➤ <b>Gourmet Enthusiasts</b></li><li>➤ <b>Wine Lovers</b></li></ul></li></ul>	<ul style="list-style-type: none"><li>❖ Target customers with Segment specific campaigns and marketing initiatives</li><li>❖ Continue to improve segmentation model by collecting new data and analyzing future campaigns</li></ul>

# Problem Statement

- ❖ Businesses can optimize marketing strategies by **understanding customer behavior and preferences**
- ❖ Unsupervised learning techniques, such as **Dimensionality Reduction** and **Clustering**, can be used to divide an existing customer base into segments
- ❖ We can train various Clustering models on past customer data, including purchasing and campaign data, to determine the most effective **customer segments**
- ❖ Customer segmentation allows **tailored marketing approaches** to reach different segments, helping to increase ROI

# Solution Approach

**Step 1: Exploratory  
Data Analysis &  
Feature Engineering**

**Step 2: Scaling &  
Dimensionality  
Reduction**

**Step 3: Clustering &  
Segmentation**

**Step 4: Segment  
Profiling**

**Step 5: Solution  
Implementation**

## Data Overview

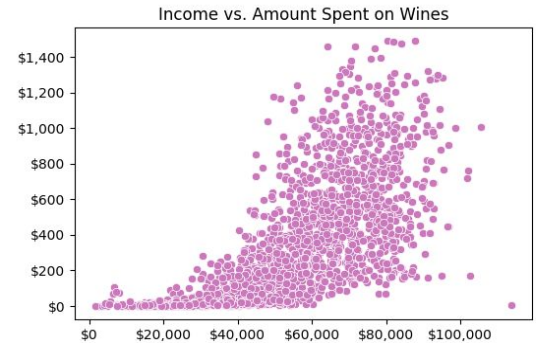

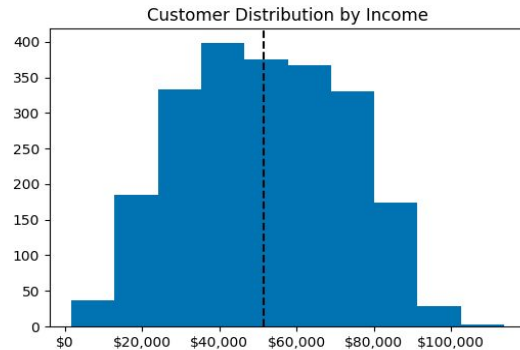

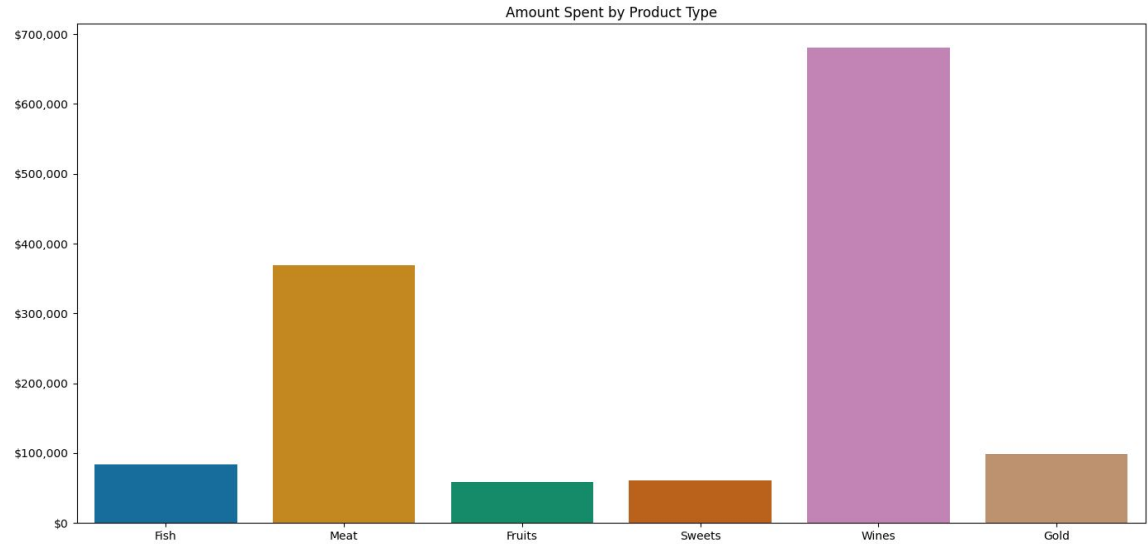

- ❖ Customer demographics
- ❖ Past purchasing behavior
- ❖ Past campaign responses

## EDA Challenges

- ❖ Missing values
- ❖ Outliers

## Key Trends

- ❖ Wine products generate the most revenue
- ❖ Strong positive correlation (0.73) between Income and amount spent on Wines

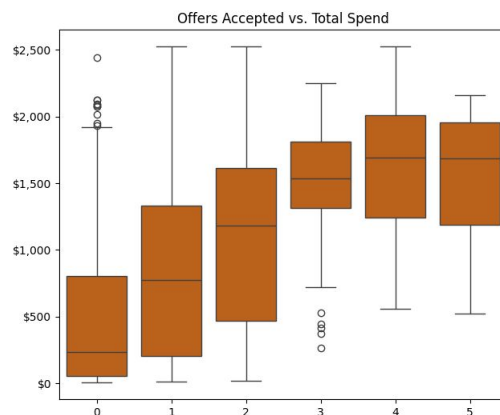

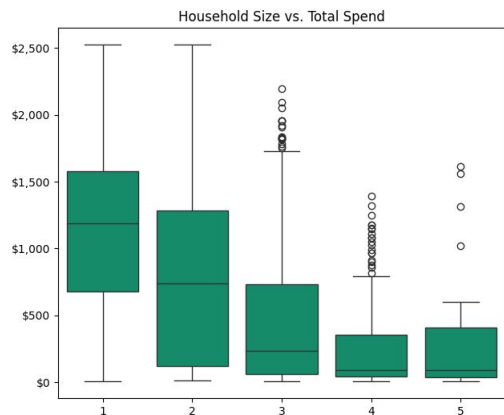

## Key Features Created

- ❖ Total Spend & Total Purchases
- ❖ Total Offers Accepted
- ❖ Household Size

## Key Trends

- ❖ Income positively correlated with Total Spend (0.82) and Total Purchases (0.70)
- ❖ Negative correlation between Total Spend and Household Size (-0.43)
- ❖ Positive correlation between Total Spend and Offers Accepted (0.46)
- ❖ 27% of customers have accepted a past offer

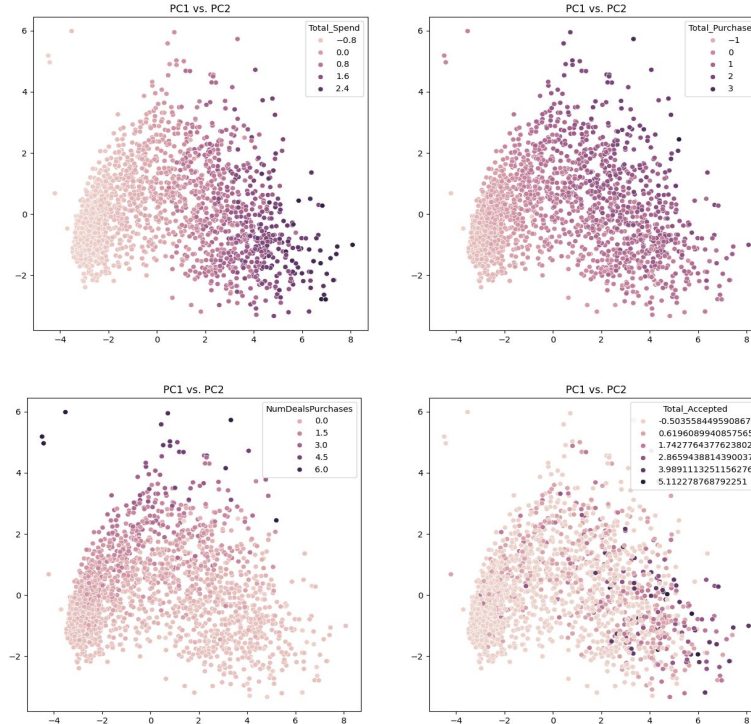

# Dimensionality Reduction

**List of features** included in PCA and final training data:

- ❖ Total Spend
- ❖ Spend by category (Fish, Meats, Fruits, Sweets, Wines, Gold)
- ❖ Total Purchases
- ❖ Amount Per Purchase
- ❖ Purchases by channel (Store, Web, Catalog, Discount)
- ❖ Number of Web Visits
- ❖ Recency (of last purchase)
- ❖ Customer Tenure
- ❖ Total Offers Accepted

(Demographic features were eliminated from Clustering model, but later used for segment profiling)

## Principal Component Analysis (PCA)

- ❖ PCA was initialized with 17 principal components
- ❖ PC1 captures variations related to overall spending behavior
- ❖ PC2 captures differences in channel engagement, including discount purchases

(Data was transformed with StandardScaler prior to applying PCA)

# Clustering & Segmentation

## Model Testing

The following models were tested for their ability to identify effective Customer Segments:

- ❖ K-Means
- ❖ K-Medoids
- ❖ Hierarchical (Agglomerative) Clustering
- ❖ DBSCAN
- ❖ Gaussian Mixture Model

Criteria for model success included:

- ❖ Silhouette Score
- ❖ Cluster Interpretability
- ❖ Relevant Insights
- ❖ Potential Repeatability

## Recommended Model

**K-Means** with 5 Clusters, trained on 10 PCs

- ❖ Silhouette Score = 0.26
- ❖ 10 PCs capture 90% of the variability in the data

# Segment Profiling

Budget Navigators	Family Savers	Moderate Spenders	Gourmet Enthusiasts	Wine Lovers
<p>Lowest-income customers</p> <p>Lowest spending across all categories</p> <p>Fewest purchases across all channels</p> <p>Largest segment, with 988 customers</p> <p>Youngest age group</p> <p>Frequent web visits</p> <p>Least likely to accept campaign offers</p>	<p>Middle-income customers with families</p> <p>Highest preference for discount purchases</p> <p>Relatively low spending in all product categories</p> <p>Household size of 2-5</p> <p>Higher than average web visits and web purchases</p>	<p>Mid-to-high income customers with average spending</p> <p>Mid-range spending across all categories</p> <p>Oldest age group</p> <p>Highest preference for in-store purchases</p> <p>Households tend to be smaller</p> <p>Least likely to accept campaign offers</p>	<p>High-income customers buying food products</p> <p>Mid-to-high spending across all categories</p> <p>Highest-spending on Sweets, Fruits, Meat, and Fish</p> <p>Higher preference for catalog purchases</p> <p>Households tend to be small with no kids</p>	<p>High-income customers buying wines</p> <p>Mid-to-high spending across all categories</p> <p>Highest-spending on Wines, and overall</p> <p>Smallest segment, with 172 customers</p> <p>Higher preference for catalog purchases</p> <p>Most likely to accept campaign offers</p>

# Recommendations & Next Steps

## Solution Implementation

- ❖ Work with Marketing team to reevaluate past campaign messaging
- ❖ Create new segment-specific marketing strategies
- ❖ Conduct A/B tests for new messaging and outreach channels

## Potential Benefits

- ❖ Increased marketing efficiency and ROI
- ❖ Increased customer loyalty
- ❖ Ability to target prospects more effectively, creating a competitive advantage

## Potential Risks

- ❖ Model overfitting or overgeneralization
- ❖ Operational challenges

## Next Steps for Analysis

- ❖ Validate and adjust K-Means model based on A/B test results
- ❖ Incorporate additional data to refine K-Means model and segment profiles

# Appendix

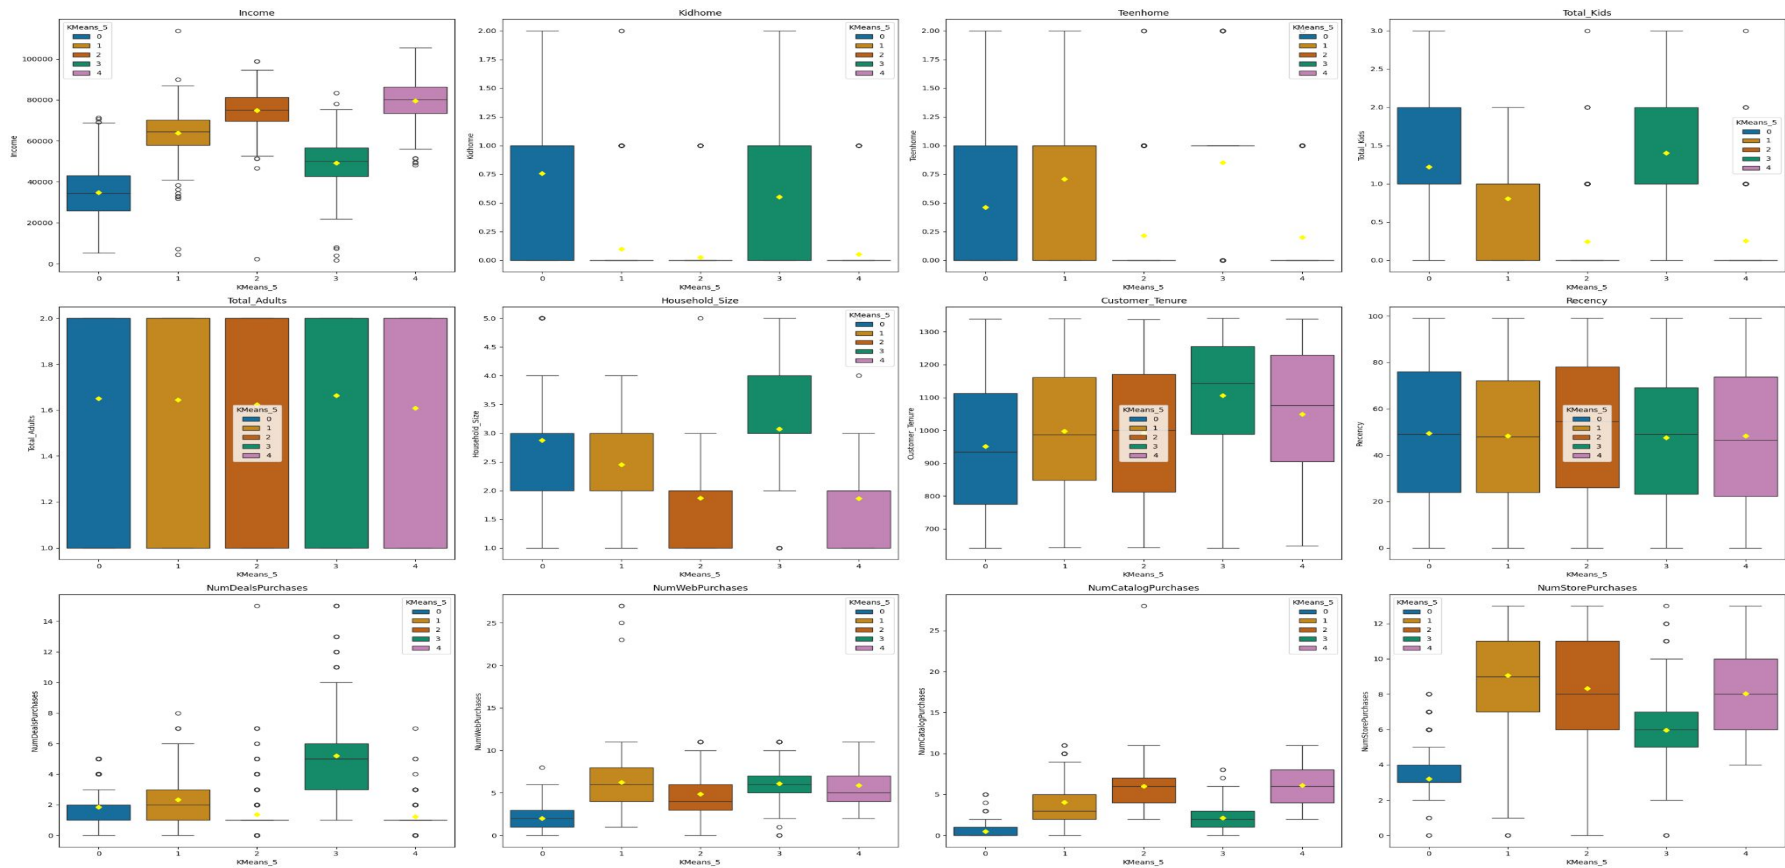

# PCA Explained Variance

# Model Comparison

Model	Clusters	Silhouette Score
K-Means	5	0.26
K-Medoids	5	0.13
GMM	5	0.12
Agglomerative	3	0.26
Agglomerative	5	0.23
DBSCAN	2	0.54
